EXPERIENCE THE AUDINA DIFFERENCE

Audina® Hearing Instruments, Inc. was established in 1990 with a dedicated team of skilled individuals sharing a common vision - to build and distribute the finest products, while offering outstanding service with integrity and value. Today, Audina's associates continue to share that same commitment to designing and building state-of-the-art custom hearing instruments. Many of Audina's engineering, technical and sales associates have over 30 years of experience in the hearing industry. Our team is devoted to improving the quality of life for every person who wears an Audina hearing instrument.

- Privately owned American company
- Advanced technology
- Comprehensive product line to accommodate all hearing loss needs
- International reputation - exporting to over 30 countries
- Recognized as a hearing industry leader
- Legendary customer service
- ISO Certified, 9001, 13485, CE

In this day of corporate conglomerates, Audina takes pride in maintaining its independence. An American privately-owned and operated company, Audina has established itself as a truly global organization with loyal and satisfied clients on every continent.

By maintaining ISO certification, Audina is demonstrating its commitment to our four measurable quality objectives: Quality, Delivery, Continual Improvement, and Committed Quality Suppliers. Our clients can be assured that Audina is an organization that is committed to providing them with products that meet the highest quality standards; built by highly skilled and trained professional personnel.

Naturally Comfortable

Audina®
HEARING INSTRUMENTS, INC.

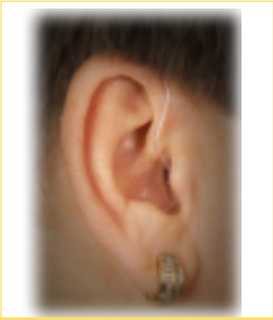
CHOOSE THE BEST OPTION

Whether you are a first-time user or replacing an existing hearing instrument - you are making a decision to improve the quality of your life. Over the last several years, technology has advanced at record rates, creating the most sophisticated instruments to improve your hearing.

Two of the most common statements from individuals who wear hearing instruments are "I feel plugged-up" and "I don't like the sound of my own voice".

The nVē eliminates these concerns, providing a naturally comfortable fit that is almost invisible. With the receiver (speaker) in your ear canal, the "echo chamber" sensation common with many other hearing aids is virtually eliminated. Utilizing an open fitting allows the ear canal to be open offering brilliant digital clarity without the plugged-up feeling.

Actual Size



Here's what you will see

FEATURES

- Receiver in the Canal (RIC) eliminates the uncomfortable "echo chamber" sound common to other hearing aids.
- Multiple programs (up to 4) available for different listening situations such as dining in a restaurant, participating at a place of worship, or enjoying a party.
- Lightweight and virtually invisible
- Automatically eliminates or reduces the annoying whistling (feedback) noise without affecting what you want to hear.
- Reduces annoyance and fatigue of background noise while giving clarity and low distortion to speech, resulting in clear speech understanding.
- Extra long battery life with low consumption levels.

MAKE THE RIGHT CHOICE

Why Two Hearing Instruments are Better than One:

Patients sometimes ask why their hearing healthcare professional recommends two hearing instruments rather than one. If you have a hearing loss in both ears, you are most likely a candidate for two hearing aids. Similar to the way refractory problems in both eyes are treated with a pair of glasses, it makes sense that bilateral hearing loss should be treated with binaural hearing aids. While a hearing healthcare provider can best determine if you are a candidate for two instruments, the ultimate decision is yours.

Consider these important advantages of a binaural (two ear) fitting:

- A more natural, "stereo sound" and an overall balanced feeling
- Improved ability to identify the direction of the sound, which is crucial for safety
- Hearing is less tiring and listening is more pleasant
- Increased ability to understand speech in normal conditions and noisy situations
- Less volume needed, which reduces the interference of background noise and the chance of feedback
- Keeps both ears active, reducing the chance of the unaided ear losing its ability to hear or understand
- Greater comfort when loud noises occur
- Smoother tone quality and improved clarity
